Method / Parameter	Analyte(s)
GC/MS Analysis	Diacetyl
	2,3-Pentanedione <i>(aka: Acetyl propionyl)</i>

Summary of Method:

A measured volume of sample is combined with a volume of acetonitrile. A known amount of internal standard (Butanedione-d6) is added and the vial is capped and mixed thoroughly to combine. An aliquot is then analyzed quantitatively against a linear calibration curve using a GC/MS equipped with a mass selective detector. In this analysis, the limit of quantitation (LOQ) is 8.27 ug/mL for 'Diacetyl' and 8.53 ug/mL for '2,3-Pentanedione'.
